1. Smoke / Heat Alarms

1.1 Basic Information about your Smoke / Heat Alarm

A Smoke Alarm is an early warning device. Used correctly it can give the occupants valuable time to escape. Heat Alarms are used supplementary to Smoke Alarms for those areas where Smoke Alarms would not be suitable.

Notes:-

- * When the power is first connected the Smoke / Heat Alarm may sound for 2-3 seconds and/or the LED may flash quickly for 10 seconds **this is normal**.
- * A Smoke / Heat Alarm does not prevent fires.
- * Install in correct position (refer to section 1.4).
- * Test monthly.
- * When the Smoke / Heat Alarm beeps every 40 seconds <u>and</u> LED flashes at the same time the battery backup is low, restore mains power as soon as possible.
- * For the Photo-electric model PFS-PCX, if the Smoke Alarm beeps <u>without</u> the LED flashing at the same time then clean the unit (refer to Owners Manual) as this is the automatic test feature telling you the chamber is degraded.
- Plan your escape route.
- * Proper protection may require more than one Smoke / Heat Alarm.
- * If you have any doubt or query about Smoke / Heat Alarms consult the nearest Brooks Australia Fire and Warning Systems Office.

1.2 Technology Available

Brooks offers a full range of detection technologies.

- Ionisation
- Photo electric
- Heat

1.2.1 Ionisation model

Ionisation Smoke Alarms are certainly the most popular in domestic situations, due in no small measure to the fact that they are the least costly to produce. They respond to a sufficiently wide range of fire to be of general use and they are particularly responsive to fast flaming fires where little visible smoke may occur. They are seldom troubled by dust or insect contamination. However, ionisation alarms are vulnerable to irritating nuisance alarms caused by cooking fumes, or portable gas heaters. Excessive nuisance alarms may lead to the alarm being disconnected. Furthermore ionisation alarms will be slower to respond to smoke produced by slow smouldering fire. This type, with consideration to the above, can be installed in passageways and areas leading to bedrooms.

Operating Principle

Radioactive source ionises the air molecules within the sensing chamber.

Advantages

- Least expensive to produce
- Dual chamber compensates for changing ambient conditions
- Less prone to false alarms due to dust and steam
- Suitable for general use

Disadvantages

- Contain radioactive material
- Cannot be disposed of in landfill
- Must be returned to supplier or Health Department
- Cannot be sent via the post
- Prone to false alarms due to fumes from cooking or gas/oil heaters
- Not sensitive to dark smoke from a slow smouldering fire

1.2.2 Photo-Electric model

Optical Smoke Alarms on the other hand sense visible smoke particles, again they respond to a sufficiently wide range of fires to be of general use, but they are particularly responsive to smouldering fires and the dense smoke given off by foam filled furnishings or overheated PVC wiring. They are much less prone to nuisance alarms from cooking, and furthermore, contain no radioactive material. However, all optical smoke alarms are prone to nuisance alarms caused by dust or insect contamination. Mesh screens are effective in reducing insect ingress, but it is impossible to make the alarms dust proof, since they would then be effectively smoke proof! For this reason it is essential that optical smoke alarms are always kept clean. This type, with consideration to the above, should be installed within bedrooms and living areas adjacent to kitchens.

Operating Principle

Light scattering - transmitter produces pulses of light which are detected by a receiver when smoke enters the sensing chamber.

Advantages

- No radioactive material
- No legal requirements for disposal
- Particularly responsive to smouldering fires and dense smoke given off from foam filled furnishings, bed linen or over-heated PVC wiring
- Less prone to false alarms due to fumes from cooking or gas/oil heaters
- Ideally suited adjacent to kitchens and bedrooms
- Suitable for general use

Disadvantages

- More expensive to produce
- Prone to false alarms due to dust build up or steam must be kept clean

1.2.3 Heat model

Residential type **Heat Alarms** require the least maintenance of any alarm, because they are virtually impervious to contamination. There are instances where a smoke alarm installation is not recommended, the kitchen being the prime example. Yet this area of a house is the source of some 40% of fires. An alternative method of fire detection is in the opinion of many fire officers and specifiers, essential in this and other vulnerable locations of residential properties. Fixed temperature heat alarms are designed to trigger when the temperature reaches 58 degC. (136 degF.) The alarms are not sensitive to smoke, but in a closed room with a vigorous fire they will tend to respond faster than a smoke alarm out in the hallway. A heat alarm **must** be interconnected to your smoke alarms so that the alarm can be heard throughout the building. This type, with consideration to the above, can be installed in kitchens, laundry's and garages.

Operating Principle

Thermistor sensor - resistance value varies with temperature.

Advantages

- Ideal for those areas where protection is deemed necessary but where the use of smoke alarms will cause constant false/nuisance alarms, i.e., kitchens, garages, laundries
- Whilst not sensitive to smoke, in a closed room with a vigorous fire this alarm would tend to 'alarm' faster than a smoke alarm in an adjacent hallway

Disadvantages

- More expensive to produce
- Not an early warning device, should <u>always</u> be interconnected to other smoke alarms within the residence.

1.3 Locating your Smoke / Heat Alarm

Ionisation and Photo-Optical Alarms

Sufficient smoke must enter your Smoke Alarm before it will respond. Your Smoke Alarm needs to be within 10 paces (7 metres) of the fire to respond quickly. It also needs to be in a position where its alarm can be heard throughout the residence, so it can wake all occupants in time for all to escape. A **single** Smoke Alarm will give some protection if it is properly installed, but most residences will require **two** or more Smoke Alarms to ensure that a reliable early warning is given. For maximum protection you should put individual Smoke Alarms in all the rooms where fire is most likely to break out.

Your first Smoke Alarm should be located between the sleeping area and the most likely sources of fire (living room or kitchen for example). But it should not be more than 10 paces (seven metres) from the door to any room where a fire might start and block your escape from the house.

1.3.1 Single Storey Dwelling

If your home is on one level (a bungalow or mobile home for example) you should put your first Smoke Alarm in a corridor or hallway between the sleeping and living areas. Place it as near to the living area as possible, but make sure you can hear it loudly enough to wake you in the bedroom (for example, see figure 1).

If your home is very large and the corridor or hallway is more than say 22 paces (15 metres) long, one Smoke Alarm will not be sufficient. This is because no matter where it is located it will be more than 7.5 metres from potential fires.

Recommended Protection Figures (1 & 2)

- Minimum protection
 each storey
 each sleeping area
 every 7.5 metres (25 ft) or hallways and rooms
- Maximum protection
 All rooms (except bathroom)

In houses with more than one sleeping area, Smoke Alarms should be placed between each sleeping area and the living area.

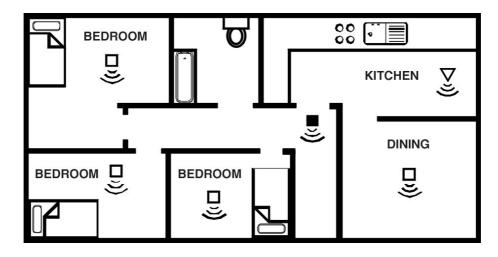

Figure 1

1.3.2 Multi Storey Dwelling

If your home is on more than one level you will require at least 2 Smoke Alarms. The best place for your first Smoke Alarm is in the downstairs hallway near the stairs. (for example see figure 2). This is because smoke is likely to be detectable in the hallway before it reaches the upstairs landing and bedrooms.

Your second Smoke Alarm should be upstairs, because the downstairs Smoke Alarm is unlikely to detect the smoke from a fire in a bedroom upstairs. Both Smoke Alarms should be interconnected to ensure the earliest possible warning.

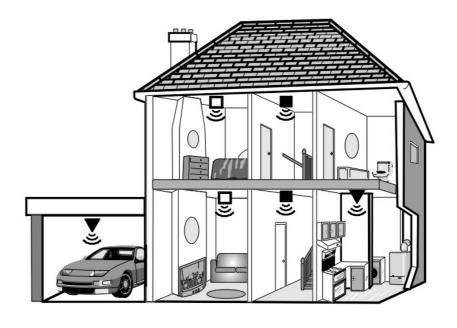

Figure 2

1.3.3 Maximum Protection

For maximum protection you should put individual Smoke Alarms in all the rooms where fire is most likely to breakout (apart from the locations to avoid, mentioned below). The living room is the most likely place for a fire to start at night, followed by the kitchen and then the dining room. You should also consider putting Smoke Alarms in any bedrooms where fires might occur, for instance, where there is an electrical appliance such as an electric blanket or where the occupant is a smoker. You could also consider putting Smoke Alarms in any rooms where the occupant is unable to respond very well to a fire starting in the rooms, such as an elderly or sick person or a very young child.

1.3.4 Checking you can hear your Smoke Alarm

With the Smoke Alarm sounding in its intended location, check you are able to hear it in each bedroom with the door closed, above the sound of your radio. The radio should be set to a reasonably loud conversation level. If you can't hear it over your radio the chances are that it wouldn't wake you.

If a Smoke Alarm is too far way for it to wake you, it is best to place another Smoke Alarm near the bedroom. The Interconnection Facilities on the Smoke Alarms are designed for this, when one alarm senses smoke all connected alarms respond.

Note: Options within the Smoke Alarm and Residential Fire Panel enable customising of the installation.

1.4 Positioning your Smoke Alarm

Hot smoke rises and spreads out, so a central ceiling position is the preferred location. The air is "dead" and does not move in corners, therefore Smoke Alarms must be mounted away from corners. Place the unit at least 30cm (12 inches) from any light fitting or decorative object which might obstruct smoke entering the Smoke Alarm. Keep at least 15cm (6 inches) away from walls and corners. (see figure 4).

1.4.1 Wall Mounting

When a ceiling position is not practical (for example on a ceiling having exposed beams or joists, or built-in radiant heating) put the top edge of your Smoke Alarm between 15 and 30 cm (6 and 12 inches) below the ceiling. Keep at least 15cm (6 inches) from corners. (see figure 4).

1.4.2 On a Sloping Ceiling

In areas with sloping or peaked ceilings install your Smoke Alarm 90 cm (3 feet) from the highest point measured horizontally (see figure 4), because "dead air" at the apex may prevent smoke from reaching the unit.

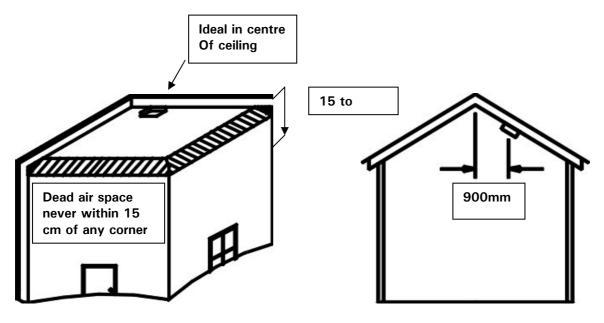

Figure 4

1.4.3 Locations to Avoid

Don't place your Smoke Alarm in any of the following areas:

- Kitchens, Bathrooms, shower rooms, garages or other rooms where the smoke alarm may be triggered by steam, condensation, normal smoke or fumes.
- Attics or other places where extremes of temperature may occur (below 4°C/34°F or above 40°C/104°F).
- Near a decorative object, door, light fitting, window moulding etc., that may prevent smoke from entering the Smoke Alarm.
- Surfaces that are normally warmer or colder than the rest of the room (for example attic hatches, uninsulated exterior walls etc), Temperature differences might stop smoke from reaching the unit.
- Next to or directly above heaters or air conditioning vents, windows, wall vents etc. that can change the direction of airflow.
- In very high or awkward areas where it may be difficult to reach the alarm (for testing, maintenance etc).
- Locate unit at least 1.5m (5 feet) and route wiring at least 1m (3 feet) away from fluorescent light fittings as electrical "noise" and/or flickering may affect the unit.

- Locate away from very **dusty** or **dirty areas** as dust build-up in the chamber can make unit too sensitive and prone to alarm. It can also block the insect screen mesh and prevent smoke from entering the chamber.
- Do not locate in insect infested areas. Small insects getting in to the chamber can cause intermittent alarms.

1.5 Limitations of Smoke Alarms

Smoke / Heat alarms have significantly helped to reduce the number of fire fatalities in countries where they are widely installed.

However independent authorities have stated that they may be ineffective in up to 35% of all fires. There are a number of reasons for this:

- Smoke Alarms will not detect fire if sufficient smoke does not reach the alarm.
 Smoke may be prevented from reaching the alarm if the fire is too far away.
 Installing smoke alarms on both sides of closed doors and installing more than one smoke alarm as recommended in this handbook very significantly improves the probability of early detection.
- Smoke / Heat Alarms which are not maintained or are tampered with may not function reliably.
- The Smoke Alarm may not be heard.
- A smoke alarm may not wake a person who has taken drugs or alcohol.
- Smoke Alarms may not detect every type of fire to give sufficient early warning.
 They are particularly ineffective with: fires caused by escaping gas, violent
 explosions, poor storage of flammable rags and/or liquids, (for example petrol,
 paint, spirits etc) overloaded electrical circuits, arson, children playing with
 matches.

Smoke Alarms don't last indefinitely. The manufacturer recommends replacement after 10 years as a precaution.

2. Residential Fire Panel

2.1 Functional Description

The Residential Fire Panel provides the necessary control, monitoring and power supply functions required by the Residential Alarm System.

2.1.1 Power supply

2.1.1.1 Primary Power Supply / Battery Charger

The primary power supply is fully regulated and has mains surge suppression fitted. Nominal output is 13.7V DC, maximum current 500mA. In an alarm condition any additional current is supplied by the secondary supply (battery). The power supply circuitry is integrated with the field wiring terminations on the Termination Board.

2.1.1.2 Secondary Supply

The secondary supply is a 12V 6.5AH Sealed Lead Acid Battery which under normal operating conditions will be continuously charged by the primary power supply. If the primary power supply fails the secondary supply will provide a minimum of 72 hrs (3 days) normal operation followed by a minimum of 168 hrs (7 days) in the low battery condition.

2.1.2 Termination of Field Wiring

All field wiring enters the panel via knock outs on either the top or rear of the panel and is then terminated on the Termination Board. An optional zone output card may also be fitted.

2.1.2.1 Smoke Alarm Inputs

The termination board is clearly labelled for positive supply (+), negative supply (-) and interconnect (I) for Zone 1 to Zone 6. When terminating each zone disconnect the End Of Line device and re-terminate it at the last Smoke / Heat Alarm on the zone. Figure 6 shows how the field wiring is terminated on the termination board.

2.1.2.2 Mains Voltage Input

The 240V AC mains cable terminates at the mains isolating switch located on the inside rear of the cabinet.

2.1.2.3 Battery Input

Leads for the connection of the lead acid battery are already connected to the termination board. Ensure correct fitting of the battery, connect the Black lead to the negative terminal and the Red lead to the positive terminal.

2.1.3 Panic Input

This input allows for the manual activation of the Residential Fire Alarm System. On operating this input, all alarms and ancillary equipment will be activated into the full fire alarm condition. Activation is via any normally open dry contact, such as a Break Glass alarm or panic button. These should be mounted on adjacent to the panel itself.

2.1.4 Common Alarm Outputs

The RFP6D has a 12 volt dc output (maximum 1 Amp) and a set of Changeover Dry Contacts. Any zone facility entering an alarm condition will activate these outputs. In supplying both Voltage and Voltage free contacts the user has the design flexibility to control any ancillary function required.

e.g. the 12 volt output could be used to operate an external audio/visual warning device. The Changeover Dry Contacts could be used to control a magnetic door holder power supply or to signal a Remote Monitoring Station. In this way your residential fire system can be monitored on a 24 hour, 7 day basis.

2.1.5 Alarm Confirmation Period (Selectable)

The common alarm outputs respond with 3 options: no delay (standard), 30 second or 60 second time delay. Time delay is selected by a 4 way dip switch mounted on the back of the main board (refer to figure 7). This provides a means of delay to enable the occupant to remove a known false alarm, ie. burnt toast, before a remote warning is given.

2.1.6 Defect Mode Output

The Defect Mode Output responds to a system fault such as mains fail, line fault (short or open circuit), activation of the ancillary isolate switch or panel switched off. The defect mode provides a set of changeover dry contacts. These can be used for either local and / or remote warning of a system fault.

2.1.7 Zone Facility (ZF)

The Zone Facility (ZF) contains all the necessary circuitry to connect the smoke alarms to the Residential Fire Panel (RFP6D). This is normally a three wire system. Two wires supply power to the smoke alarm, the third wire is an interconnect. An end of line (EOL) device provides a means of monitoring these three lines for either an open circuit or short circuit condition. A fault indication, audio (chirps) and visual (LED), will be indicated on the relevant zone.

2.1.8 Mimic Panel (Optional)

An Individual Smoke / Heat Alarm Mimic Panel is available for where the exact location of the actuated Smoke / Heat Alarm is required. The mimic panel is available with either 24, 48, or 72 mimic indicators as a standard product, or can be custom built to reflect the building layout. The Remote Indication output on each Smoke / Heat Alarm is wired back to the mimic panel using two wires.

2.1.9 Zone Output Facility (Optional)

An optional card which allows for separate zone outputs is available when ancillary devices are required to operate on an activated zones basis only. Two set of voltage free contacts is supplied for each zone which can be used to control equipment such as bells, sirens, or flashing lights, strobes and door holders etc. The contact rating of the relays is 1A @ 12V.

2.2 Specifications

No. of zones : 6

No. of Smoke/Heat Alarms: 72 max (12 per zone)

Power Supply : Input 240V AC

Output 12.3 -13.8 VDC, Typical 13.70 VDC

Standby Supply: 12V/6.5AH sealed lead acid battery

Battery low setting : 12.3 VDC

Keyswitch Operation: "ON" System ON - Charger ON

"OFF" System OFF - Charger ON

"FIRE" activates all smoke/heat alarms

System Monitoring: Wiring loop in and loop out to Smoke/Heat

Alarms monitored by active End of Line Device

Defect Mode : Initiated by an abnormal system condition:

* Mains Fail

* Ancillary output (common alarm) Isolated

* Short circuit line fault * Open circuit line fault * System switched off

Defect Output (Fault): 1 set changeover dry contact

Alarm Outputs : 12V DC 1 Amp maximum

1 set changeover dry contact

Panic Input : N/O dry contact - activates all S/H Alarms

Note: Not monitored

Sounder Silence Switch : Acknowledges panel sounder

Alters tone from continuous to chirp (for

battery low and line fault)

Ancillary Isolate Switch : Isolate common alarm outputs

Initiate Defect Mode

Alarm Locate Switch : Silences all Smoke/Heat Alarms except those

initiating the alarm . Interlocked to fire mode

to prevent accidental operation

Visual Indications : Individual zone alarm - Red

Individual zone fault - Amber Ancillary isolate - Amber Locator activated - Amber Sounder silence - Amber

Power ON - Green

Smoke/Heat Alarms

(Refer to jumper set up Fig. 6)

Remote indication output - latching or non

latching.

:

Standalone or common alarm operation

Panel Features

(Refer to Dip Switch set up on Fig. 7)

Common or independent zone operation

Latching or non latching alarm indication

Alarm confirmation period: 0 Sec, 30 Sec or 60 Sec

Common Alarm Output latching or non latching

OPTIONS

Zone Output Card : 1 set C/NO/NC changeover dry contact per zone

1 set C/NO dry contact per zone

Mimic Panel : 24 Smoke/Heat Alarm indication or

48 Smoke/Heat Alarm indication or 72 Smoke/Heat Alarm indication

Cabling : 3 core 16/0.20 red sheath (standard)

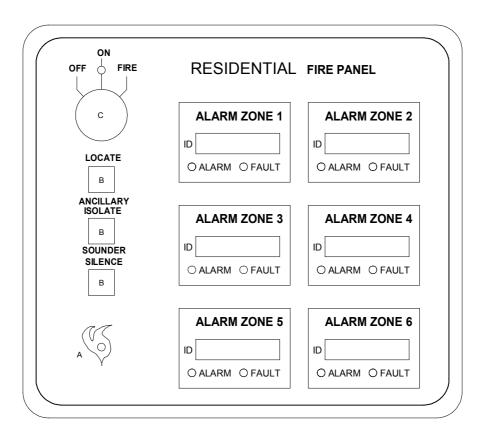

4 core 16/0.20 red sheath (maximum options) 2 core 16/0.20 red sheath (for RIL or Mimic)

BROOKS AUSTRALIA RFP6 Installer ISSUE 4 16

2.3 Familiarisation

The purpose of this section is to make you familiar with the operating and construction of the RFP range of Residential Fire Panels.

Panel Overlay

Standard Mimic Overlay (Optional)

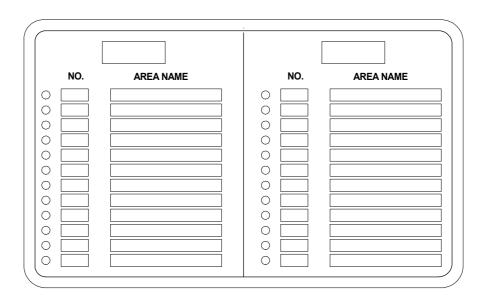

Figure 5

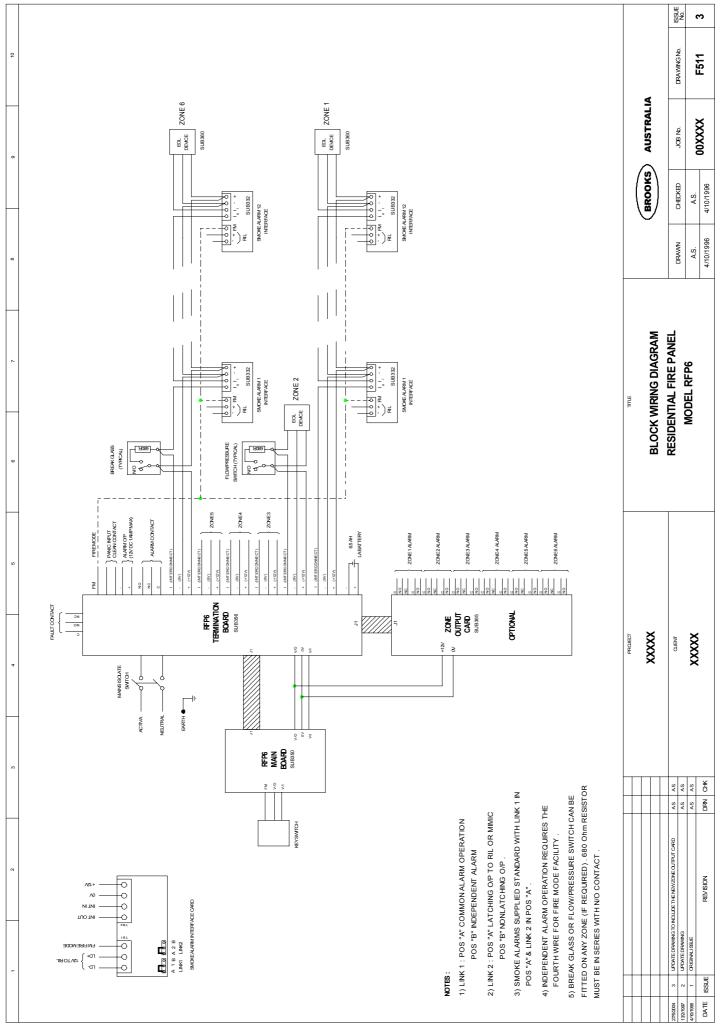

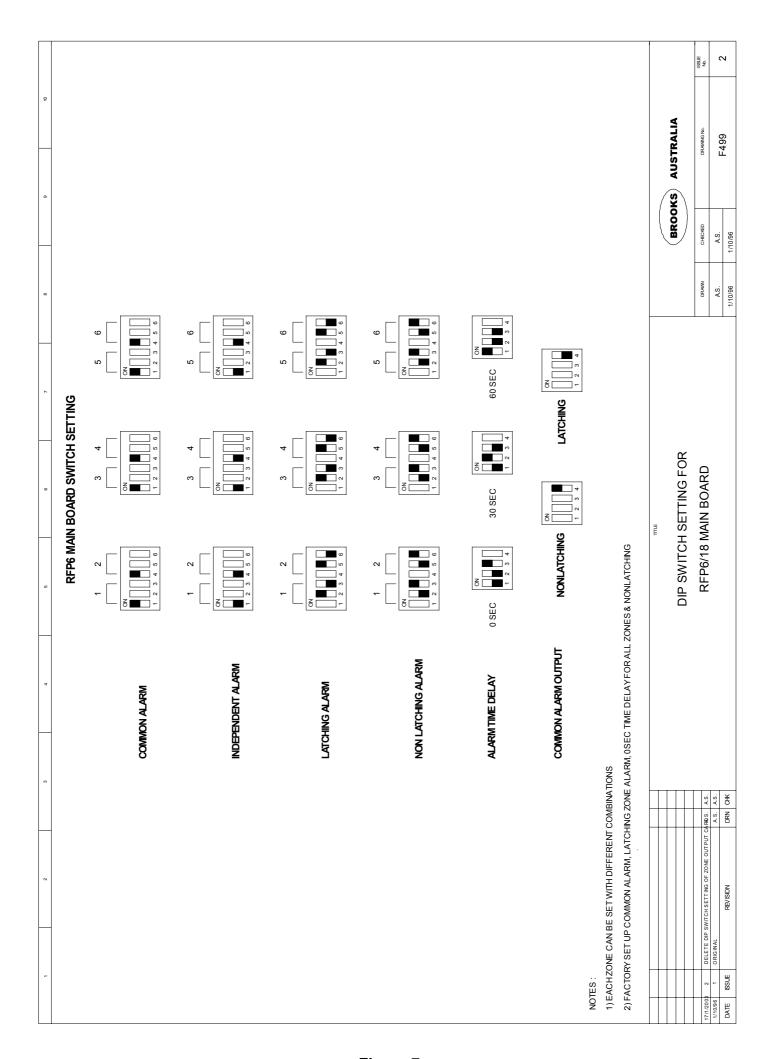

Figure 6

2.5 Panel Status

2.5.1 Normal

All ancillary 'off'
All sounders 'off'
All yellow indicators 'off'
All red indicators 'off'
One green indicator 'on'

Note: When panel is first switched "on", all zone fault LEDs will illuminate for few seconds. This is normal.

2.5.2 Zone Alarm

Zone alarm indicator 'on' (Red LED); Panel/Smoke Alarms Sounding; Ancillary outputs activated.

The red indicator will show the zone and thereby the general location of the fire alarm. In case of false alarms see Trouble Shooting in section 6.

2.5.3 Zone Fault

Zone fault indicator 'on' (amber LED);

Panel sounder sounds continuously (activate the Sounder Silence switch, sounder will sound (chirp) once every 40 seconds until fault is cleared); Defect Mode output activated.

2.5.4 Low Battery

With the mains disconnected, the panel operates solely off the battery. Once the battery reaches a preset low level 12.3Vdc then the fault sounder will pulse once every 40 seconds to give an audible indication that the system is running low on capacity (all zone fault indicators must be off). Mains should be restored as a matter of urgency. The system will operate for a minimum 7 days from the initial low battery signal.

2.5.5 Ancillary Isolate

Ancillary (alarm) outputs can be isolated from the panel using the ancillary isolate switch. When isolated, an amber LED built in the switch body will be illuminated, the sounder will sound continuously and the defect mode activated.

2.5.6 Alarm Locate Switch

This mode enables the smoke/heat alarm which originated the alarm signal to be identified. Press the 'Locate' switch, the amber indicator built into the switch body will illuminate. Now place the key into the keyswitch and turn to 'Fire'. All Smoke/Heat alarms will now silence except the unit(s) which have of themselves activated.

2.5.7 Sounder Silence Switch

Used only to silence alarm or fault sounder. For a fault condition the sounder changes from continuous output to chirp once per minute. This chirp cannot be silenced and acts as a continuous audible warning that the sounder is silenced and a fault condition still remains. When activated the amber indicator built into the switch body will illuminate.

3. TESTING

This section describes the procedure to ensure that your RFP system is fully functional and is not intended as the commissioning test procedure (Refer to section 5).

3.1 Before You Test Your RFP System

Before you can test your RFP system it is important to ensure that any ancillary equipment i.e. a security system, fire/smoke doors, A/C shutdown etc, has been isolated by the ancillary isolate switch on the front of the panel. The switch will illuminate when it has been isolated. If you wish to test any ancillary equipment it is advised that any relevant people i.e. tenants or a security / fire monitoring company, be notified before continuing as the defect mode will be initiated.

3.2 Panel Test

- Step 1. Turn the key switch to the 'Fire' position. All smoke alarms should activate.

 (If ancillary equipment has not been isolated they will also activate)
- Step 2. Once all alarms have been verified press the Locate switch on the panel. All the alarms should silence.
- Step 3. Go to the last alarm (this alarm will contain the End of Line device) for each zone and press the Test button for 15 seconds. During this time only the detector you are testing should activate.
- Step 4. Return the key switch to the "On" position and press the Locate switch ensuring that the switch illumination turns off.
- Step 5. Randomly press the Test button on over 50% of the alarms ensuring that the alarm activates and the alarm indicator for the zone under test illuminates on the panel, and, if panel is configured for common zone operation all other alarms activate. If the panel is configured for separate zone operation only the alarms in the zone being tested activate.

Note: If a mimic panel or RIL is connected to the alarm being tested check that it also illuminates at this time.

Step 6. Proceed to the smoke alarm containing the end of line (EOL) device, this is the last smoke alarm wired onto each zone. Remove the end of line (EOL) device, the panel should now sound a fault signal (continuous sound), and the fault LED for this zone will illuminate. Return the EOL and the fault signal stops. This test should be done for each zone.

- Step 7. If there is a device connected to the defect mode output, check that the device is activated when:
 - * Power is switched "off"
 - * Ancillary Isolate Switch is "on"
 - * Following procedure in step 6 and fault LED is illuminated
- Step 8. Return the panel to its normal operating condition and reset any latching indicators by switching the key switch to the "Off" position and then back to the "On" position.

Note: If latching ancillary devices are used these will need to be individually reset.

If system has been customised the functions selected may require additional testing.

If during testing any of the above steps fail, refer to the "**Trouble Shooting**" section 6 in this book. If you are unsure of any test results please do not hesitate to contact Brooks Australia on 1300 65 8000.

4. Installation

The Residential Panel is factory pre-wired and fully tested before delivery. After receipt of the panel, the unit should be carefully checked for any possible mechanical damage during transportation. Report any damage to your supplier immediately.

4.1 Surface Mounting Instructions

- Step 1. Locate the position where the panel is to be sited.
- Step 2. Mark the position of the two mounting holes (160mm apart) and the cable cut-outs, 5 knockouts available between the two mounting holes. **Note that Power and ELV cables are to be kept segregated**.
- Step 3. Select the appropriate mounting hardware and prepare the two mounting holes.
- Step 4. Fix the top two points, leaving approximately 6 mm of the protrusion from the wall. Mount the Panel and secure all mounting hardware.

4.2 Recommended Mounting Hardware

Masonry

Drill - 6.5 mm Rawlplug - Green

Fastener - 8 gauge x 25 mm zinc plated self-tapping screws

Plaster Board

Drill - 8 mm

Fastener - Hollow wall anchors type SWA416 or equivalent

Solid Timber

Drill - 3 mm

Fastener - 8 gauge x 25 mm zinc plated self-tapping screws

4.3 Cable Terminations

4.3.1 AC Power

The 240V AC input is terminated on the mains isolate switch and earth stud provided on the rear inside of the enclosure.

25

NOTE: This panel can be wired to the AC Power Input or connected to a GPO via a 3-core flex cable, whichever is the more appropriate.

4.3.2 Field Wiring

All field cabling is to be terminated on the Terminals provided as per Fig 6. The Figure shows the conventional Block Wiring Diagram using 3 or 4 core cable for each zone as per options selected.

Cables should be terminated as required. Ensure all cables are neat and secured using approved plastic ties.

4.3.3 Battery

Fit Battery into bottom of enclosure.

RED - POSITIVE BLACK - NEGATIVE

Using the mounting hardware provided, secure the front panel to the enclosure.

5. Commissioning of Installation

5.1 General

The fire alarm installer shall ensure that all documentation, logbook, handbook (operators and installers manuals), as-installed drawings, and check list are available at the time of commissioning.

The fire alarm system installer shall rectify any faults in the fire detection and alarm installation, as appropriate, where the results of the commissioning tests are outside the manufacturer's limits.

5.2 Commissioning Tests

The following tests shall be performed:

5.2.1 System Configuration

- Step 1. Ensure that the smoke alarm locations and the Residential Fire Control Panel are appropriate for the type of site and usage.
- Step 2. Check that all smoke alarms used in the system are:
 - listed in this manual
 - compatible with the installed zone facility, particularly that the permitted
 - number of Smoke Alarms for each zone is not exceeded; and
 - installed in an environment for which they are suitable
- Step 3. Check that the AC mains power supply for the system has been provided in accordance with AS3000.
- Step 4. Visually check all field wiring terminations (refer to the panel wiring instructions).
- Step 5. Ensure the End of Line Devices are in correct location, visually confirm wiring is correct (refer to the smoke alarm wiring instructions).
- Step 6. Check that the battery is fitted. It should be of a suitable type and capacity (refer to Table 1)
- Step 7. Check that all zone facilities have been labelled and that the alarm zone is immediately apparent from the labelling.
- Step 8. Check that as-installed drawings have been correctly marked up and that they are consistent with the installation.
- Step 9. Record the results of the commissioning test on the commissioning sheet in this Handbook.

5.2.2 Ancillary Functions

'PANIC' - Disconnect the 'Panic' input and using a multi-meter set to ohms check for an Open Circuit across the field wiring. Operate the 'Panic' device and ensure meter reads short circuit, reset the panic device if necessary and ensure it again reads open circuit. Reconnect the wiring.

'12 Volt' - Disconnect the field wiring and using a multi-meter set to ohms ensure that there is no short circuit between the field wiring inputs. (The exact field resistance will be a function of the device connected i.e., Fire Bell - 150 ohms). Reconnect the wiring.

5.3 Panel Testing

5.3.1 General

- Connect Battery Leads: Red Positive
 - Black Negative
- Connect Power and Switch ON the Mains. All zone fault LEDs will illuminate for a few seconds and sounder will sound
- Power 'on' LED should light green, no other facility or indicator should function

5.3.2 Alarm Test

- Ensure control panel is in the "Normal" condition, keyswitch in the "ON" position. Power on - Green LED.
- Turn the key switch to place the panel in 'FIRE' mode
- Check:
 - 1. No Alarm LED illuminates
 - 2. All smoke alarms sound
 - 3. Ancillary Outputs activate. Check operation of all ancillary equipment.
- Switch to "FIRE/LOCATE" by pressing the Locate switch to 'ON' while key is still in Fire Mode. Amber LED illuminates. All alarms are silenced.
- Return Key switch to 'ON'. Turn Locate switch off. (i.e. amber LED extinguishes).

NOTE: Some ancillary equipment may be latching or simply require re-setting. This should be done before proceeding.

5.3.3 Fault Test

- Step 1. On the termination board disconnect any wire of the three wires (Positive, Negative, Interconnect) to the smoke alarms of zone1. Ensure:
 - * Zone1 fault LED illuminates
 - * The panel buzzer will sound continuously.
 - * Activate the sounder silence switch. The buzzer will pulse once every 40 seconds (chirp).
 - * Defect Mode relay contact will changeover.
- Step 2. Restore the wire, amber fault LED extinguishes. The Panel buzzer will be silenced and defect mode contacts return to normal.
- Step 3. Repeat steps 1 and 2 for each zone.

Note: Many options on the Residential Panel are user selectable. Additional testing may be required if the system has been customised. Refer to system as installed details.

5.3.4 Power Supply

Power supply voltages are pre-set at the factory to 13.7V DC.

Operate the AC supply switch off and on at least five times to check that the system will not false alarm from AC power interruptions.

5.3.5 Field Testing

With the Control Panel in its NORMAL MODE:

- Step 1. Proceed to the smoke alarm on zone 1 which contains the end of line (EOL) device. Remove the EOL and ensure that the control panel has registered a fault condition. For this zone reconnect the EOL and the fault condition clears.
- Step 2. Press and hold the test button for at least 5 seconds, Smoke alarm will activate, ensure that an alarm has registered at the panel. All ancillary outputs should activate.
- Step 3. Turn keyswitch to 'OFF' then back to 'ON'. The alarm led will extinguish and all ancillary outputs will reset.
- Step 4. Repeat steps 1 3 for each zone.
- Step 5. Press 'Locate' and turn key switch to 'Fire' (FIRE/LOCATE MODE).

 Press Ancillary Isolate. Proceed to each smoke alarm on each zone in turn and activate the Test button. The individual smoke/heat alarm will sound standalone. Check any associated Remote Indicator lights.

Release Test button and smoke alarm will silence. If selected, check remote indicator remains lit. (This can be reset from the panel as per Step 3 above.)

Step 6. If there is a device (e.g. strobe) connected to the defect mode

- * Control Panel is switched off
- * Mains supply is switched off
- * Ancillary Isolate switch is activated
- * Fault LED illuminates during step 1.

5.4 As-Installed Diagrams and Installer's Statement

An as-installed diagram of the wiring layout of the complete installation, including the positions of the Smoke Alarms and zone facilities, should be provided before a final inspection is made.

5.5 Log Book

A log should be kept by the person on-site responsible for the fire alarm system. The responsible person's name and contact details should be kept at the RFP. This log shall include provision for recording all known alarms (genuine, false, practice, or test), and all faults and disconnections. All alarms and tests recorded shall remain in the log and shall be available at all times. A separate section of the owners manual or book shall be provided to record all service/maintenance details.

5.6 Maintenance

For the continuous reliability of the system, provision shall be made for the regular maintenance of the installation.

A properly designed and installed detection system offers effective life and property protection. However, for ongoing reliability the system <u>must</u> be maintained at its peak performance. A poorly maintained system can lead to nuisance alarms or complete system failure.

Under these conditions, you have wasted your initial investment and do not have the level of protection needed.

- 1. It is recommended that the owner test each smoke alarm every month. The panel alarm test should also be performed.
- 2. It is also recommended that each 6 months a full system test be performed by a suitably qualified servicing company. Battery and power supply voltages should be checked and adjusted, if necessary, at this time.

6. Trouble Shooting

6.1 False Alarms

In the event of a "false alarm" - it is imperative that the cause is determined and corrective action taken.

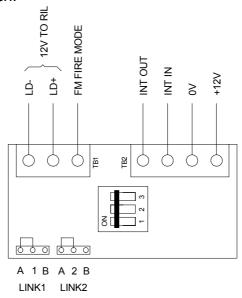

Condition: False Alarm - System is fully activated - Red Alarm LED 'ON'

Step 1. Operate the **LOCATE** switch so that it is illuminated and turn key to **FIRE**. This silences the panel and all the smoke alarms except the one which initiated the alarm. Listen and you will be able to determine where this smoke alarm is located.

NOTE: The panel does not latch in alarm (depends on system set up), so when the smoke alarm resets, the panel resets.

Step 2. Try to determine the cause of the alarm It may be a "simulated condition" such as dust, steam, insect spray, cooking fumes, gas heater etc. Fan the smoke alarm vigorously with a newspaper or cloth to try and clear any contaminant from inside the sensor. If the smoke alarm silences return to the panel and go to Step 3..

If the Smoke Alarm cannot be silenced pull open its cover and find the isolation switch as shown in the diagram below. (Some alarms may not have this type of switch; in that case, simply leave the cover open). Slide the switch to the OFF position. You have deactivated the alarm and it will no longer be capable of sensing smoke. Also, any interconnected smoke alarms between this one and the smoke alarm at the end of the line on the zone will not be able to send an alarm signal back to the panel. Call the service technician responsible immediately. Return to the Control Panel and ensure that all switches are in the normal position. A fault will be indicated. Activate the Sounder Silence switch.

Smoke Alarm with cover open

Step 3. Turn the Panel key switch to "OFF'; wait approximately 10 seconds, then turn the system back on.

6.2 Faults

A fault is present when the sounder in the Control Panel sounds continuously (or beeps about every 30 seconds with the Sounder Silence switch activated) and no red alarm LED is illuminated.

6.2.1 Line Fault

If a zone fault (amber) LED is illuminated and the sounder is sounding continuously, then an Open Circuit or Short Circuit has occurred. If a Short Circuit has occurred then the fuse on the zone will be blown. If an Open Circuit has occurred the fuse will be intact. The field wiring should be disconnected and metered to locate the source of the fault.

6.2.2 Low Battery

If the Control Panel sounder emits a short beep about every 30 seconds and no red or amber LED is illuminated and the Sounder Silence switch is not activated, a low battery condition is indicated. This may be caused by the 240 volt Mains being off for at least 72 hours. Mains power should be restored as a matter of urgency. If the Mains has not been off, **call the service technician responsible immediately.**

FOR FURTHER ASSISTANCE PLEASE DO NOT HESITATE TO CONTACT YOUR LOCAL DISTRIBUTOR OR BROOKS FIRE AND WARNING SYSTEMS

6.3 Spare Parts

6.3.1 Main Panel

ITEM

1.	RFP6 Main & Display Board	SUB350/PCB130/3
2.	RFP6 Termination & Supply	SUB356/PCB134/1

STOCK No.

3. End of Line Device SUB360/PCB132/1
4. Zone Output Card SUB365/PCB133/0
5. Lead Acid Battery BBAT12V6.5

5. Lead Acid Battery BBAT12V6.56. 003 Key Switch SK150

7. Mains Isolate Switch SW160
SW161
SW162

8. Ribbon Cable & Connectors CA115
9. Fuse Fast Blow 1.5Amp FU155
10. Fuse Fast Blow 1Amp FU160

6.3.2 Smoke / Heat Alarms

11. Ionisation Smoke Alarm
 12. Photo Electric Smoke Alarm
 13. Thermal Alarm
 14. S/H Alarm Interface Card
 15. EIPFSICX6
 16. EIPFSTCX6
 17. SUB332/PCB116/4

To obtain any of the spare parts shown or equipment service, please contact your nearest local distributor or Brooks Australia Fire and Warning Systems.

Product Guarantee

Brooks Fire Detection Products are guaranteed for a period of either fifteen (15) months from the date of purchase or twelve (12) months from the date of operation, whichever is the lesser. If the product has any defect due to faulty workmanship or material it will upon return to Brooks be repaired or replaced free of charge.

On returning a component or complete product, proof or purchase will be required. If returning the complete product all accessories and documentation MUST be returned.

This guarantee does not cover damage caused to the product or its components as a result of incorrect installation, misuse, careless handling or where repairs have been made or attempted by others. On site warranty repairs will be carried out at the discretion of the manufacturer.

No other guarantees written or verbal are authorised to be made on behalf of Brooks. All other conditions and warranties whether expressed or implied are, to the extent permitted by law, hereby excluded.

As Brooks has no control over the system's design, installation to the relevant Australian Standard or maintenance, the Company and its agents take no responsibility for any damage, financial loss or injury caused to any equipment, property or persons resulting from the use of the Residential Fire Panels.
